

FIG. 100E. 20. E 5328 F 660

T\_1: {a, b, c, d, e, f, g}

T\_2: {d, f, g}

T\_3: {a, b, d, g}

T\_4: {a, d, g}

T\_5: {f, g}

T\_6: {e, f, g}

T\_7: {e, g}

102

Example for Dependency (50% as threshold)

{ag}

$P(a|g) = \text{count}(ag) / \text{count}(g) = 3/7$

$P(g|a) = \text{count}(ag) / \text{count}(a) = 3/3$

a->g, but not g->a

{ab}

$P(a|b) = 2/2$

$P(b|a) = 2/3$

a -> b, and b->a, (ab) is not frequent

Patterns Count

a	3
b	2
c	1
d	3
e	3
f	4
g	7

104

Patterns Count

a b	2
a d	3
a e	1
a f	1
a g	3
.....	

106

FIG. 1

minsup = 3; minp = 0.6

{ab} is frequent, but not m-pattern

$$P(a|b) = \text{count}(ab)/\text{count}(b) = 1;$$

$$P(b|a) = 3/10$$

{dc} is m-pattern, but not frequent

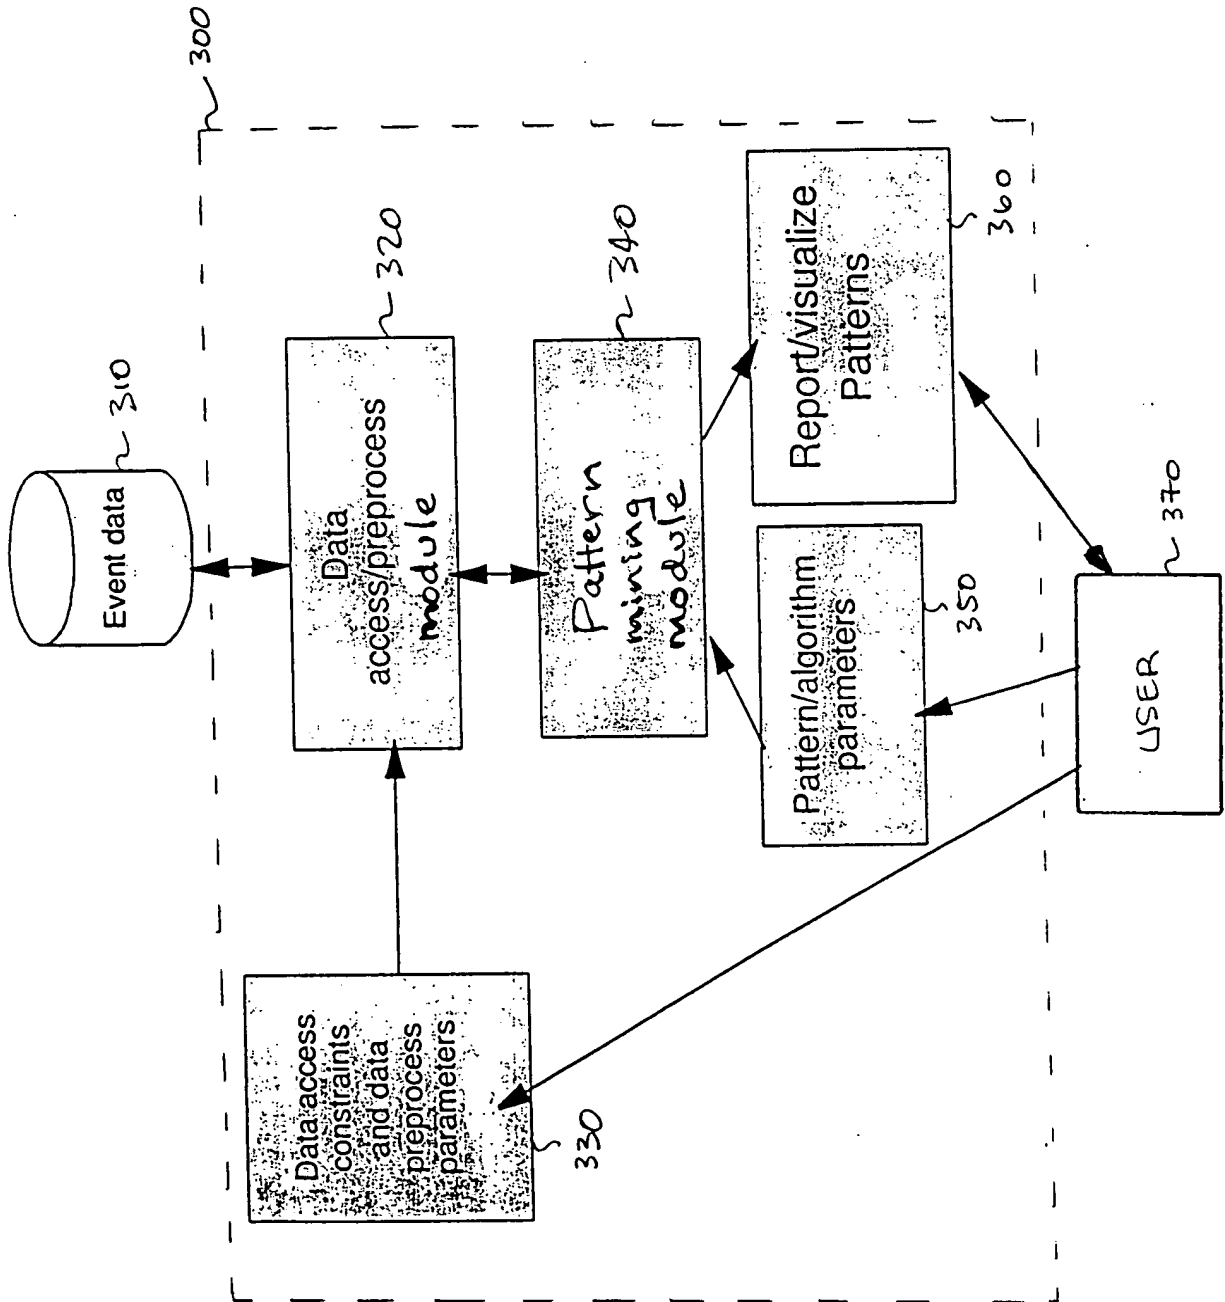

$$P(d|c) = 2/3; P(c|d) = 1;$$

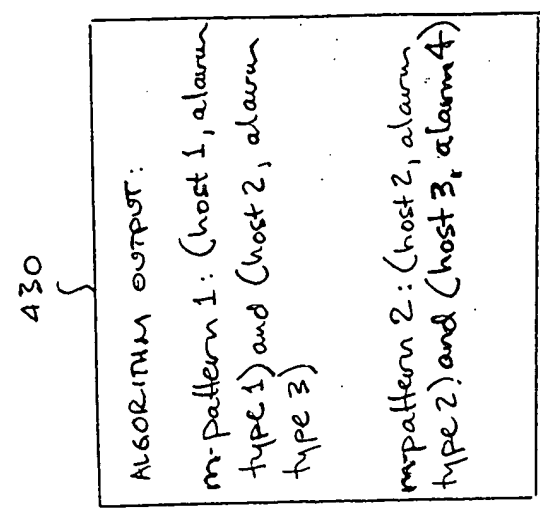

Patterns	Count	Patterns	Count
a	10	ab	3
b	3	ac	2
c	2	dc	2
d	3	....

FIG. 7

FIG. 7

- Input: a set of candidates  $C_k$ , count information at all previous levels, and a threshold  $\min p$
- Output: a set of pruned candidates  $C''_k$
- Algorithm
  - For each pattern  $pat$  in  $C_k$ 
    - For each item  $a$  in  $pat$ 
      - ◆ Compute:  $prob = Count(pat-a)/Count(a)$ ;
      - ◆ if  $prob < \min p$ 
        - $C_k = C_k - pat$
        - break the for-loop
  - Return  $C''_k$

FIG. 8A

- Input: pattern  $pat$ , all count information, and a threshold  $minp$
- Output: true if  $pat$  is a qualified m-pattern; otherwise false.
- Algorithm
  - For each  $a$  in  $pat$ 
    - $prob = Count(pat)/Count(a)$
    - if  $prob < minp$ 
      - ◆ return false
  - Return true
- This algorithm is  $O(k)$
